</tbody>
</table>
TEST DESIGN: Randomized block (by rep)

NUMBER ENTRIES: 8

NUMBER REPLICATIONS: 4

TEST MEAN: 1,460 lbs./A yield (corrected to 10% moisture) with 58% large seed

TEST YIELD C.V.: 14.1%

COMMENTS: Rainfall was well above normal through planting then adequate through the cropping season with the exception of May. Soil profile moisture was nearly saturated at planting, and moisture was available to the plants for the entire season. No visible wilting or stress was observed. Head moth pressure was never heavy, but the test was sprayed three times to ensure good control. Lodging coincided with heavy rain and strong winds from Hurricane Alex on June 30-July 1 (>6” of rain) right before harvest. Lodging was due to root upheaval rather than stalk breakage; with the weight of the head, the wind, and the soft soil, some plants fell over. This was more pronounced for confectionary hybrids where the head is larger than for oilseed hybrids, which are planted at higher plant population. A plant was considered lodged if it had fallen well below the harvest height of a combine header or was on the ground.

Confectionary seed was priced at $22/cwt. This is the most common means of pricing confectionary sunflower in South Texas rather than a two-tiered price for large (>20/64”) and small seed. The price is equivalent to $25/$15 with 70% large seed.

Confectionary seed size ranged from mediocre to good, or 42 to 70%. Plant population was slightly lower than targeted, but plants were uniformly spaced which is often more important than actual plant number. Test weights were generally good for confectionary.

An adjacent oilseed sunflower hybrid test yielded 1,539 lbs./A with a crop value of $232/acre.

**Trial Notes:** Rainfall was above normal through planting then adequate through the cropping season except May. Soil moisture was near full capacity at planting and remained high through the season. Lodging (root upheaval, not stalk breakage) coincided with heavy rain, strong winds, and soft soils from Hurricane Alex on June 30-July 1 (>6” of rain) right before harvest. A plant was lodged if it fell well below the harvest height of a combine header or was on the ground. Plants/A was lower than the target of 13,800 plants/A due to small skips in stand.

An adjacent oilseed sunflower hybrid trial (10 hybrids) yielded 1,539 lbs./A with an average crop value of $232/acre.
