

## Evaluation of Harvest Aid Chemical Treatments on Late-Season Hail Damaged Cotton - 100% Defoliated

Wells, TX - 2003

Tommy Doederlein, Mark Kelley, Randy Boman, and Mark Stelter Extension Agent-IPM, Dawson/Lynn Counties, Extension Program Specialist-Cotton, Extension Agronomist-Cotton, and Extension Assistant-Cotton

## Lynn County

- No significant differences were observed for any of the parameters measured at this Summary: location (Tables 1 and 2). Lint yields ranged from a high of 478 lb/acre to a low of 367 lbs/acre for Prep at 16.0 oz/acre applied 5 days after hail event (DAHE) and Finish 6 Pro at 24 oz/acre applied at 10 DAHE respectively. A test average of 421 lbs of lint/acre was observed. Loan values for the test averaged \$0.4485/lb of lint which resulted in a \$189.60/acre test average lint value. After adding lint and seed values, the total values (\$/acre) ranged from a high of \$270.35/acre to a low of \$196.00/acre. Costs for harvest aid chemicals ranged from a high of \$30.90/acre for Finish 6 Pro at 32 oz/acre plus Ginstar EC at 4.0 oz/acre to a low of \$5.66/acre for Gramoxone Max at 5.5 oz/acre plus non-ionic surfactant at 0.25% v/v (4.8 oz/acre). Net values were calculated by subtracting ginning and chemical costs from the total values and ranged from a high of \$213.64/acre, for the untreated check, to a low of \$133.87/acre for Finish 6 Pro applied 10 DAHE at 24 oz/acre, a difference of \$79.77/acre. Results from this study indicate that, under these conditions, use of harvest aids did not increase net return.
- **Objective:** The objective of this project was to evaluate the effect of various harvest aid chemicals and rates, alone and in tank mixes, on yield, fiber quality and economic return when applied to cotton after a late season hail event.

## Materials and Methods:

Variety:	Deltapine 5690RR
Planting date:	May 25
Experimental design:	Randomized complete block with 4 replications
Plot size:	4 rows by 50 feet
Hail event date:	September 7
Defoliation percent:	Cotton was 100% defoliated by hail

Harvest aid treatments:

Treatment number and description

Treatments applied 5 days after hail event (Sept 12)

Chemical cost (\$/acre)

\$12.86

1	Untreated Check	\$0.00
2	Prep @ 16.0 oz/acre	\$9.74

20 Gramoxone Max @ 5.5 oz/acre + 0.25% v/v Non-Ionic Surfactant (NIS) \$5.66

Chemical cost (\$/acre) includes a \$3.50/acre application cost.

Application information:

	Dates:	September 12 for treatments 1 through 15 (5 days after hail event) September 17 for treatments 16 through 20 (10 days after hail event)					
	Sprayer:	Lee Spider sprayer with $CO_2$ charged, 4 row multi-boom attachment					
	Nozzle type:	TeeJet® Flat Fan					
	Nozzle size:	11002 VS with 50 mesh screens					
	Nozzle spacing:	20 inches					
	Ground speed:	3.0 MPH					
	Spray volume:	15 gallons/acre					
	Operating pressure:	26 psi					
Harvest:		Plots were harvested on October 15 with a modified John Deere 482 plot stripper with integral digital scales. Plot yields were adjusted to lb/acre.					
Gin tu	irnout:	Grab samples were taken by plot and ginned at the Texas A&M Center at Lubbock to determine gin turnouts.					
Fiber	analysis:	Lint samples were submitted to the International Textile Center (ITC) at Texas Tech University for HVI analysis, and USDA loan values were determined for each treatment by plot.					
Ginning costs and seed values:		Ginning costs are based on \$2.25 per cwt. of bur cotton and seed values are based on \$125 per ton. Ginning costs do not include checkoff.					
Chemical costs:		Chemical costs were determined for each treatment using an average retail price for chemicals and adding an application cost of \$3.50/acre.					

## Results and Discussion:

No significant differences or obvious trends were observed for any of the parameters measured at this location (Tables 1 and 2). Lint yields ranged from a high of 478 lb/acre to a low of 367 lbs/acre for Prep at 16.0 oz/acre applied 5 days after hail event (DAHE) and Finish 6 Pro at 24 oz/acre applied at 10 DAHE respectively. A test average of 421 lbs of lint/acre was observed. Loan values for the test averaged \$0.4485/lb of lint which resulted in a \$189.60/acre test average lint value. After adding lint and seed values, the total values (\$/acre) ranged from a high of \$270.35/acre to a low of \$196.00/acre. Costs for harvest aid chemicals ranged from a high of \$30.90/acre for Finish 6 Pro at 32 oz/acre plus Ginstar EC at 4.0 oz/acre to a low of \$5.66/acre for Gramoxone Max at 5.5 oz/acre plus non-ionic surfactant at 0.25% v/v (4.8 oz/acre). Net values were calculated by subtracting ginning and chemical costs from the total values and ranged from a high of \$213.64/acre, for the untreated check, to a low of \$133.87/acre for Finish 6 Pro applied 10 DAHE at 24 oz/acre, a difference of \$79.77/acre. Results from HVI analyses indicated no significant differences among treatments at this location. Micronaire values averaged 2.8 units, which resulted in low loan values. Staple values ranged from a high of 34.2 (32<sup>nds</sup> inches) to a low of 33.2 with a test average of 33.6. A test average of 29.4 g/tex was observed for fiber strength. Results from this study indicate that, under these conditions, use of harvest aids did not increase net return. It should be noted that decisions should not be based solely on the results from one location.

- Acknowledgments: Appreciation is expressed to Dr. John Gannaway, Professor TAES, Lubbock for the use of ginning facilities and to Lyndell Gilbert, Technician II - TAES for his assistance with the stripper.
- **Disclaimer Clause:** Trade names of commercial products used in this report are included only for better understanding and clarity. Reference to commercial products or trade names is made with the understanding that no discrimination is intended and no endorsement by the Texas A&M University System is implied. Readers should realize that results from one experiment do not represent conclusive evidence that the same response would occur where conditions vary.
