

Verticillium Wilt Trials

By Terry Wheeler¹ and Cecilia Monclova-Santana²

Texas A&M AgriLife Research¹ and Texas A&M AgriLife Extension Service²

Lubbock, TX

The funding for the study came from Texas Cotton State Support Program.

Floydada test: This test was planted on 18 May and harvested on 16 October. It was irrigated with a center pivot system. The field experienced water stress during the flowering and boll filling stages due to the weather conditions and the pump for the center pivot system went down. Verticillium wilt was low to moderate at this site and ranged from 3% to 26% depending on variety. Defoliation which was moderate ranged from 22 to 65%. Lint yield ranged from 1,185 to 1,590 lbs/acre. Loan value ranged from \$0.529 to \$0.575/lb and lint yield x loan value ranged from \$635 to \$894. Yield was affected by both Verticillium wilt and by water stress. The varieties that had the combination of the best yield, yield x loan value, lowest incidence of Verticillium wilt, and least defoliation were FM 2202GL, FM 1911GLT, ST 5600B2XF, and NG 4098B3XF.

Plainview test: This test was planted on 18 May and harvested after an ice storm on 12 November. The field experienced at least one significant hail event during the growing season. Irrigation was with a center pivot system. Verticillium wilt incidence ranged from 8 to 38%, which was slightly higher than the Floydada test and defoliation ranged from 16 to 64%, which was similar to the Floydada site. At harvest time, most of the varieties had a substantial amount of lint that had fallen off the plants, so yield was affected strongly by storm-proofness of varieties as well as Verticillium wilt. Yield ranged from 468 to 1,222 lbs of lint/acre. Yield x loan value ranged from \$268.17 to \$695.65. Loan value ranged from \$0.5788 to \$0.5280/lb. No variety was in the top rating categories of yield, yield x loan value, low wilt incidence, and low defoliation. There were many varieties with low wilt ratings. Only DP 2022B3XF and FM 2334GLT had the lowest category of defoliation ratings. Only FM 2202GL had top yield and yield x loan values.

Ropesville test: This test was planted on 19 May and harvested on 21 October (before the ice storm). This field was infested with both root-knot nematode and Verticillium wilt, so some entries were included with partial or full resistance to root-knot nematode. The field was irrigated with subsurface drip. Based on the top yielding entries, it is apparent that root-knot nematode was more impactful on yield than Verticillium wilt. Verticillium wilt incidence was low and ranged from 2 to 11%, with little separation between varieties. Defoliation was moderate to high and ranged from 24 to 82%. Yield ranged from 1,301 to 1,944 lbs/acre, and yield x loan value ranged from \$745 to \$1,114/acre. Loan value ranged from \$0.547 to \$0.582/lb. The varieties ST 5600B2XF and PHY 394W3FE had the best ratings overall for yield, yield x loan value, wilt incidence, and defoliation. Both varieties are resistant to root-knot nematodes.

Combined Analysis: FM 2334GLT was at all three sites as the Verticillium resistant check, and in the combined analysis, it had the lowest relative combined values of wilt incidence and defoliation. However, it did not yield particularly well in 2020 (relative yield was ranked 47th). The Verticillium susceptible check in all sites was DP 1909XF, which ranked 69th out of 70 entries for relative combined values of wilt incidence and defoliation. The best five entries in terms of wilt and defoliation ratings were: FM 2334GLT, PX2D18W3FE, PHY 394W3FE, FM 1911GLT, and NG 4050XF. However, when ranking all measured attributes (wilt, defoliation, yield, and yield x loan value), then the top five entries were: ST 5600B2XF, FM 2202GL, PHY 394W3FE, NG 4050XF, and FM 2574GLT.

Table 1. Effect of Verticillium wilt (low to moderate) on a variety test near Floydada.
